

# CAPITAL BI

## OVERVIEW

Capital BI from Capital Banking Solutions provides comprehensive business intelligence (BI) functionality that empowers users to make effective and informed decisions based on solid data and analyses. With this application, users can access, format, analyze, navigate and share information. Our BI solution enables advanced analytics, a customized dashboard with over 500 templates, information infrastructure, query options, reporting and analysis. Each of these functionalities integrate into a user-friendly portal that uses a powerful data warehouse connected to the products of Capital Banking Solutions and the major information systems of the banking sector.

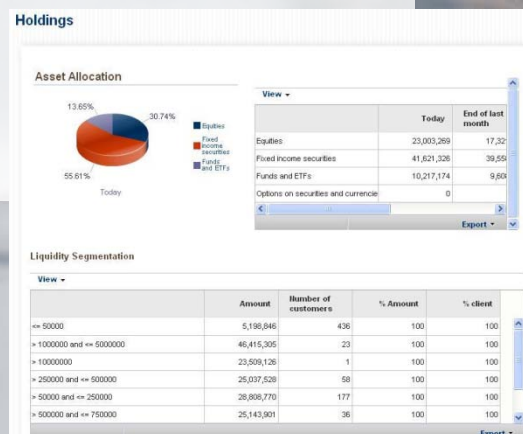

## PRODUCT INFORMATION

On a day-to-day basis, banks experience an increasing demand for expedient decision making. Instant access to information is necessary and data must be analyzed to formulate wide-ranging insights and assessments. As such, it is necessary to transform data into business information to provide the comprehensive analysis of the contribution of each banking product in terms of volume and income, the dependency in liquidity and margin regarding the different customer segmentation and the chronological evolution of bank activities expressed in terms of amount and margin.

Designed to provide inclusive business intelligence functionalities, Capital BI empowers users to make effective and informed decisions based on solid data and analyses. It also addresses the management and operating departments of the bank. Users can analyze and monitor banking activities; assess and manage risk exposure; and

define, monitor and improve overall performance.

The solution is delivered with user-friendly, customizable portal that uses a powerful data warehouse connected to the core banking and major information systems of the banking sector. The portal integrates modules for activity analysis and monitoring to fully detail a bank's activities by analyzing financial statements – such as balance sheets and income statements – and banking products, based on factors such as client deposit and loans and bill portfolio. The solution adopts multi-dimensional techniques and presents results in different customizable formats including dynamic pivot tables, matrix reports and graphs.
